

In House Branding

We have our own in house branding department with pad printing, silk-screening, laser engraving, embossing and embroidery. This gives us the capability for faster turn-around times and competitive prices to the client.

SCREEN PRINT

This branding is best for large logos. The logo is burned onto the gauze, which is tightly pulled over a metal frame. Ink is then pushed through the gauze using a squeegee, and only the burned area are transferred.

PAD PRINT

This branding is generally used on smaller products and is applied by transferring ink onto the product using a silicone cushion which is pressed onto the item

EMBOSS

A logo is imprinted onto a metal block which is then pressed down onto the material with force, and leaves the logo imprinted on the product

DOME DECAL

This is a digitally printed sticker which is cut to a conventional shape and then coated with polyurethane which give the sticker a three dimensional appearance.

FOIL EMBOSSING GOLD OR SILVER

The same process as embossing is followed but before the product is imprinted, a layer of foil is layed onto the product, the block is then pushed onto the foil and product to create the foiled imprint

LASER ENGRAVE

Laser engraving is when a laser burns a logo or design with accuracy into the product's surface.
